

Business Requirements Document

HR Analytics Dashboard (Power BI)

Project	HR Analytics Dashboard
Platform	Microsoft Power BI
Prepared For	HR & People Operations Stakeholders

1. Business Objective

Provide HR and people-operations stakeholders with a single, accessible view of workforce metrics — enabling faster, evidence-based decisions on hiring, retention, and workforce planning, while improving usability for different working environments through dark and light mode viewing options.

2. Background / Problem Statement

HR data has historically been scattered across spreadsheets and disconnected reports, making it difficult for stakeholders to get a timely, unified view of workforce trends. This lack of accessibility slows decision-making and limits engagement with the data by non-technical stakeholders.

3. Business Requirements

- Consolidate key HR metrics (headcount, attrition, recruitment, tenure, demographics) into a single Power BI dashboard.
- Provide both dark mode and light mode views to improve accessibility and viewing comfort across different environments and stakeholder preferences.
- Improve stakeholder engagement by making HR data easy to explore without technical or SQL knowledge.
- Support data-driven decisions on hiring, retention, and workforce planning.
- Ensure the dashboard is easy to maintain and refresh as new HR data becomes available.

4. Stakeholders

- HR leadership and People Operations team (primary users / decision-makers).
- Department managers (secondary users, workforce visibility).
- Dashboard owner / analyst (maintains data model and refreshes).

5. Scope

In scope: Power BI dashboard covering core HR metrics, with dark/light mode toggle for improved accessibility.

Out of scope: Real-time data streaming; integration with external non-HR systems.

6. Success Criteria

- Stakeholders can independently access and interpret HR metrics without analyst support.
- Increased engagement with the dashboard, measured by regular stakeholder usage.
- Positive stakeholder feedback on accessibility of the dark/light mode views.
